The global climate finance architecture is complex and evolving. Funds flow through multilateral channels – both within and outside of UNFCCC financing mechanisms – and increasingly through bilateral, as well as through regional and national climate change channels and funds. Monitoring the flows of climate finance is difficult, as there is no clear definition of what constitutes climate finance. The proliferation of climate finance mechanisms continues to challenge coordination. But efforts to increase inclusiveness and simplify access continue.

Climate finance

Climate finance refers to the financial resources mobilised to help developing countries mitigate and adapt to the impacts of climate change, including public climate finance commitments by developed countries under the UNFCCC, although a definition of the term “climate finance” is yet to be agreed internationally. In the 2009 Copenhagen Accord, and confirmed in the Cancun decision and Durban Platform, developed countries pledged to deliver finance approaching USD 30 billion between 2010 and 2012. With this period ended, contributor countries self-reported that these targets were exceeded (Nakhooda, Fransen et al. 2013). While there is no clarity on mid-term finance targets, countries have reiterated their commitment to increasing climate finance to USD 100 billion per year from public and private sources by 2020. Many countries have highlighted the need for international support in implementing their National Adaptation Plans (NAPs) as well as their Intended Nationally Determined Contributions (INDCs) (Hedger and Nakhooda, 2015), and ensuring that finance and investment is available to realise these goals will be the major challenge going forward. Developing countries have made the case for finance to address climate change loss and damage already occurring in their countries as a result of climate change. The Warsaw Mechanism on Loss and Damage presently, however, has no links to finance.

A study commissioned by the French and Peruvian Governments in their capacities as Presidents of COP 21 and 20, respectively concluded that USD 62 billion in public and private sources were directed to developed countries from developing countries in 2014 (OECD, 2015). It is notable that the majority of this wider reading of climate related funding comes from the private sector and the additionality of public finance identified is unclear (i.e. how much of this represents effort over and above existing efforts and development finance commitments). CFF 1 presents a longer discussion of the principle of additionality.

Figure 1 presents an overview of the global architecture, focusing particularly on public climate financing mechanisms. There are a number of channels through which climate finance flows, including multilateral climate funds that are dedicated to addressing climate change. Several developed countries have also established climate finance initiatives or are channelling climate finance through their bilateral development assistance institutions. Many developing countries in the meantime have set up regional and national funds and channels to receive climate finance. The types of climate finance available vary from grants and concessional loans, to guarantees and private equity. The architecture has differing structures of governance, modalities and objectives. While the transparency of climate finance programmed through multilateral initiatives is increasing, detailed information on bilateral initiatives, regional and national funds are often less readily available.

A multitude of funding channels increases the options and therefore possibilities for recipient countries to access climate finance, but can also make the process more complicated. It becomes increasingly difficult to monitor, report, and verify (MRV) climate finance, coordinate a response, as well as to account for its effective and equitable use. There is opportunity, however, to draw lessons from the diversity about how best to structure climate finance to maximise impacts, and environmental, gender equality and social co-benefits. The ODI HBS Climate Funds Update seeks to track this intricate architecture while ODI’s work program on the effectiveness of international climate finance offers some insights to this end (http://www.climatefundsupdate.org/effectiveness).

Climate Funds Update tracks operating entities of the UNFCCC, large multilateral climate funds, bilateral funds that feature prominently in reporting to the UNFCCC, and funds that have had a significant demonstration role. It does not track all climate funds or all channels of climate finance, due to limits to available information as well as resource limitations.

Multilateral channels for climate finance

Multilateral climate finance initiatives often break from contributor country-dominated governance structures, typical in development finance institutions. This gives developing country governments greater voice and representation in decision-making. Steps to increase inclusion and accountability in multilateral fund governance have been taken, including by creating a role for non-governmental stakeholders as observers to fund meetings, with varying degrees of active participation opportunities.

Established in 1991, the Global Environment Facility (GEF) is an operating entity of the financial mechanism of the UNFCCC with a long track record in environmental funding. Resources are allocated according to the impact of dollars spent on
environmental outcomes, but ensuring all developing countries have a share of the funding. In the GEF fourth replenishment (2006-2010), 31 countries pledged just over USD 1 billion for the climate change focal area, most of which has been approved and disbursed to both climate change mitigation and adaptation projects. Under the GEF fifth replenishment (2011-2014), 40 donor countries pledged USD 1.35 billion to the climate change focal area. GEF 5 has approved a total of USD 865 million for 239 projects. 30 donor countries pledged USD 4.43 billion over all focal areas to the sixth replenishment of the GEF. USD 1.1 billion will support the climate change focal area, but GEF is increasingly focused on programming that targets multiple focal areas including climate change, in thematic areas such as sustainable cities and land use and forest.

The GEF also administers the Least Developed Countries Fund (LDCF) and the Special Climate Change Fund (SCCF) under the guidance of the UNFCCC Conference of Parties (COP). These funds support national adaptation plan development and their implementation, although largely through smaller scale projects (with a country ceiling for funding of USD 20 million). The LDCF has approved USD 795 million and the SCCF has approved USD 278 million since their inception in 2002 across 68 countries.

Also formally linked to the UNFCCC, the Adaptation Fund (AF) is financed through a 2% levy on the sale of emission credits from the Clean Development Mechanism of the Kyoto Protocol as well as through contributions by developed countries. Operational since 2009, the total capitalisation (which includes developed countries’ commitments) is USD 487 million and has financed a total of 51 projects for USD 325 million. The AF pioneered direct access to finance for developing countries through National Implementing Entities that are able to meet agreed fiduciary standards, as opposed to working solely through UN agencies or Multilateral Development Banks (MDBs) as multilateral implementing agencies.

The Green Climate Fund (GCF) of the UNFCCC was agreed at the Durban COP, and is expected to become the primary channel through which international public climate finance will flow over time. It is intended to fund the paradigm shift towards climate-resilient and low-carbon development in developing countries and has adopted a country-driven approach, and a commitment of 50% allocation of finance to adaptation and mitigation. The initial resource mobilisation process for the GCF raised USD 10.2 billion. Countries can access the GCF both through MDBs and UN agencies, as well as directly through accredited National, Regional and Sub-National Implementing Entities. Throughout 2015, 20 Implementing Entities were accredited and in November 2015, the GCF approved its first eight projects for USD 168 million.

At COP 16, the Standing Committee on Finance was established under the UNFCCC to assist the COP in meeting objectives of the Financial Mechanism of the Convention. The Standing Committee on Finance has been tasked with, among other things, preparing a biennial assessment of climate finance flows. The first assessment was published in late 2014 (UNFCCC, 2014), and the second is under preparation for in advance of COP 22 in 2016.

A substantial volume of climate finance has been channelled through institutions that are not directly under the guidance of the UNFCCC COP.

The Climate Investment Funds (CIFs) established in 2008 are administered by the World Bank, but operate in partnership with regional development banks including: the African Development Bank (AfDB), the Asian Development Bank (ADB), the European Bank for Reconstruction and Development (EBRD), and the Inter-American Development Bank (IDB). The CIFs finance programmatic interventions in selected developing countries, with the objective of improving understanding of how public finance is best deployed at scale to assist transformation of development trajectories. The CIFs have a total pledge of USD 7.53 billion. They include a Clean Technology Fund with USD 5.3 billion, and a Strategic Climate Fund, composed of the Pilot Program for Climate Resilience (PPCR) with USD 1.13 billion, the Forest Investment Program (FIP) with USD 0.6 billion, and the Scaling-Up Renewable Energy Program for Low Income Countries (SREP) with USD 0.5 billion.

Multilateral Development Banks (MDBs) play a prominent role in delivering multilateral climate finance. Many have incorporated climate change considerations into their core lending and operations, and most MDBs now also administer climate finance initiatives with a regional or thematic scope. The World Bank’s carbon finance unit has established the Forest Carbon Partnership Facility (FCPF) to explore how carbon market revenues could be harnessed to reduce emissions from deforestation and forest degradation, forest conservation, sustainable forest management and the enhancement of forest carbon stocks (REDD+). It also manages the Partnership for Market Readiness, aimed at helping developing countries establish market based mechanisms to respond to climate change and the Bio Carbon Fund, which is a public-private partnership that mobilises finance for sequestration or conservation of carbon in the land use sector. The African Development Bank administers the Congo Basin Forest Fund (CBFF) and the European Investment Bank the EU Global Energy Efficiency and Renewable Energy Fund (GEEREF). In 2015 Norway and the UK, however, announced they would not provide further support to the CBFF. The AfDB also finances enhanced climate finance readiness in African countries through the German funded Africa Climate Change Fund (ACCF), whose first projects were approved in 2015.

Both MDBs and UN Agencies act as implementing entities for the GEF, SCCF, LDCF, and the AF. UN agencies commonly take on the role of administrator and/or intermediary of climate finance. The UN-REDD Programme, made operational in 2008, brings together UNDP, UNEP, and the FAO to support REDD+ activities, with the governance structure giving representatives of civil society and Indigenous People’s organisations a formal voice. The International Fund for Agriculture and Development administers the Adaptation for Smallholder Agriculture Programme (ASAP) that supports smallholder farmers in scaling up climate change adaptation in rural development programmes.

Bilateral channels for climate finance

A significant share of public climate finance is spent bilaterally, administered largely through existing development agencies. There is limited transparency and consistency in reporting of some bilateral climate finance for climate change, however, with countries self-classifying and self-reporting climate-relevant financial flows without a common reporting format, or independent verification. The Climate and Policy Initiative estimated that USD 12-19 billion was directed through governments, ministries and bilateral agencies in 2014 in addition to that spent through climate funds and development finance institutions, including climate related ODA (CPI, 2015). A total of USD 26 billion in climate related ODA in 2014 was reported to the OECD DAC. ODI studies on Fast Start Finance contributions, including the Japanese FSF contribution, present an in-depth review of the bilateral approaches that countries are taking to delivering climate finance (http://www.climatefundupdate.org/about-climate-fund/fast-start-finance).

Germany’s International Climate Initiative has approved USD 1.1 billion for a total of 377 mitigation, adaptation, REDD+ projects. The initiative is innovatively funded partly through sale of national tradable emission certificates, providing finance that is largely additional to existing development finance commitments.

The UK’s International Climate Fund has a current capitalisation of USD 5.95 billion and has channelled a substantial share of ICF money through dedicated multilateral funds, including the CIFs and the GCF. Together with Germany, Denmark and the EC, the UK also contributes to the NAMA Facility that supports
Figure 1: Global climate finance architecture diagram
nationally appropriate mitigation actions (NAMAs) in developing countries and emerging economies that want to implement ambitious mitigation measures. Germany the UK and Denmark also support the Global Climate Partnership Fund (GCPF), managed by the German Federal Ministry for the Environment, Nature Conservation and Nuclear Safety (BMU) and KfW, that focuses on renewable energy and energy efficiency through public-private partnership. Germany and the UK also support the USD 141 million REDD+ Early Movers Programme (REM).

Norway’s International Forest Climate Initiative has approved a total of USD 305 million through bilateral channels up to 2012. Sizeable pledges have been made for REDD+ activities in Brazil, Indonesia, Tanzania, and Guyana.

Regional and national channels and climate change funds

Several developing countries have established regional and national channels and funds with a variety of forms and functions, resourced through international finance and/or domestic budget allocations and the domestic private sector. The Indonesian Climate Change Trust Fund was one of the first of these institutions to be established. Brazil’s Amazon Fund, administered by the Brazilian National Development Bank (BNDES), is the largest national climate fund, with a commitment of more than USD 1 billion from Norway, on track to be met at the end of 2015. There are also national climate change funds in Bangladesh, Benin, Cambodia, Ethiopia, Guyana, the Maldives, Mali, Mexico, the Philippines, Rwanda, and South Africa (Figure 2). Many more countries have proposed national climate funds in their climate change strategies and action plans. In many cases UNDP acted as the initial administrator of national funds, increasing donor trust that good fiduciary standards will be met, but many countries are now passing these tasks on to national institutions. Data on capitalisation of national climate change funds, however, is not consistently available.

National climate change funds attracted early interest. Largely because they were established with independent governance structures that met high levels of transparency and inclusiveness, they could channel finance to projects suited to national circumstances and that were aligned with national priorities. Working through coordinated national systems could also improve transaction efficiency. In practice, however, the impact of national trust funds on strengthening national ownership and coordination remains to be seen, and the sums of finance that these funds have raised are often modest. At the same time many developing countries are beginning to incorporate climate risk into their national fiscal frameworks, and monitoring climate related expenditure.

The Caribbean Catastrophic Risk Insurance Facility (CCRIF) was established in 2007 through support of the World Bank and other development partners, but is now also funded by developing countries premiums. A 16 member-country risk pool, it offers parametric insurance. Similarly, the African Risk Capacity (ARC) centre offers a similar model as a specialised agency of the African Union.
